

How to Care for Your **HYACINTHS**

Hyacinths will flower normally under a wide range of light conditions.

Moderately moist soil is preferred. Allow soil to feel dry before thoroughly. Drain excess water in saucer at base of pot to prevent root rot and protect furniture.

Cool temperatures are ideal: 60-65°F (15-18°C) daytimes. Avoid excessive heat or cold.

To enjoy in your garden in future years, place pot in well-lighted, cool area (50-55°F/10-13°C) and keep moist after flowering. When stems and leaves are no longer green, cut them off. In mid-spring, plant bulbs outdoors in a sunny area with well-drained soil. Note: years to re-flower will depend upon size of bulbs and local climatic conditions.

KEY TIP FOR SUCCESS: A cool environment at night (50-60°F/10-15°C) will help to extend the flowering period while plant is indoors.
